Scope and notation

The complete logical architecture uses contains edges, including isolated components. R keys identify responsibilities on their immediate owners (owns). C keys identify capabilities: contributes summarizes an owns + realizes path; provides records an explicit offered capability. These annotations are not new SDL relations. Realizes is a contribution, not proof of complete or verified realization. Ownership does not imply provision, and provision does not imply realization. Rounded standalone capabilities have neither a represented contributor nor provider. Keys are sorted within this snapshot. Features and runtime allocation belong to other viewpoints.
