VP02 — Architecture and logical decomposition

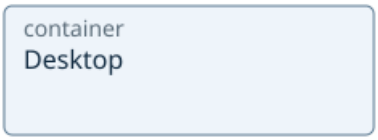
What parts exist and how are they organized?

Container/Unit and contains; library structure is not deployment allocation.

This page describes the checked model: 5 declarations and 4 source statements. Model claims do not establish implemented behavior or execution evidence.

Structure and collaboration

Declared structure and participation



Containment is logical structure. Named attachments mark existing Channels at participant boundaries; they are not declared ports. Arrows describe sender/receiver roles for the stated payload and mode, not execution order.

All explicitly declared modes are shown; no mode inheritance is inferred.

No channel participation is declared in this scope.

Reading chapters

- Containers — 1 objects. Desktop.
- Units — 1 objects. Worker.

Interpretation and unspecified behavior

Contains describes logical structure. Deployment, scheduling, runtime calls, and unnamed internal units are not inferred. Channel endpoints refer to actual declared participants.
